## Explanation of terms

---

### A

#### **Advanced AL32 Processing**

Equipped with Advanced AL32 Processing, Denon's own analog waveform reproduction technology.

The reproducibility of weak signals is enhanced by expanding 16 bit digital data to 32 bit.

### D

#### **DSD (Direct Stream Digital)**

This is a digital audio recording technology used for Super Audio CD. This enables recording and playback of audio very close to the original, allowing you to enjoy high quality audio.

#### **Dynamic range**

The difference between the maximum, undistorted sound level and the minimum sound level that is discernible above the noise emitted by the device.

### L

#### **Linear PCM**

This is an uncompressed PCM (Pulse Code Modulation) signal. Unlike lossy compression audio sources such as MP3, the audio quality and dynamic range are not reduced.

### S

#### **Sampling frequency**

Sampling involves taking a reading of a sound wave (analog signal) at regular intervals and expressing the height of the wave at each reading in digitized format (producing a digital signal).

The number of readings taken in one second is called the "sampling frequency". The larger the value, the closer the reproduced sound is to the original.
